INTRODUCTION

The forty-seventh annual report, Part II, of the Public Health Statistics Section presents tabular information regarding North Carolina's population, births, deaths, fetal deaths, marriages, and divorces. The majority of the tabulations are by place of residence; selected tabulations, in whole or in part, are given by place of occurrence. Communicable disease morbidity data are shown in Part I of the annual report of the section which is printed separately.

Reports have been published annually since 1914 with the exception of the years 1918 and 1919.

Statistics on marriages occurring in North Carolina are herein presented for the first time - 1962 being the initial year of central registration of marriages in North Carolina.

Certificates of births, deaths, and fetal deaths occurring in 1962 that were filed in 1962 and the first three months of 1963 are included in this report. It is estimated that vital events occurring in 1962 but reported after the first three months of 1963 will comprise less than one per cent of the total 1962 events. There are factual indications that registration in the State has been improving in recent years. The certificates are more complete and accurate and on the average have been filed much more promptly.

Again in 1962 a tabulation was made of all birth and death certificates filed in 1962 by year of occurrence (see 1950 or 1951 annual report for explanation of interpretation). This was done in an effort to determine the per cent of certificates filed in time to be included in an annual report as compared with those filed too late to be included. The results of this study are shown in Table 8 of this report. This tabulation was prepared by each county in order to make available a correction factor that could be used by each county to more accurately calculate the natality and mortality rates.

POPULATION

The population data in this report are estimated as of July 1, 1962 by the arithmetic method. This method assumes that each county or city had the same actual annual increase or decrease between 1961 and 1962 that it had on the average each year between 1950 and 1960.

NATALITY

In 1962 there were 109,549 live births occurring to mothers who were residents of the State. All births were allocated to the place of residence of the mother regardless of the place of birth or the length of residence. Births occurring in hospitals, sanatoria, and all other institutions, were allocated to the place where the mother lived. Births occurring on military bases to military personnel were allocated according to the residence shown on the certificate. The crude birth rate was 23.5 births per 1,000 population. There were 75,166 white births and 34,383 nonwhite births. For the seventeenth consecutive year, over 100,000 births were recorded.

This State defines a fetal death as a fetus showing no evidence of life after complete birth if the twentieth week of gestation has been reached. There were 1,998 resident fetal deaths reported, resulting in a ratio of 18.2 fetal deaths per 1,000 live births. If fetal deaths were considered as a single cause of death, they would rank fourth between cancer and influenza and pneumonia as a leading cause of death.

PREMATURE BIRTHS

In order to achieve uniformity in the classification of premature infants in need of special care, and comparability of statistical data in hospitals and in studies of such infants, the definition of the American Academy of Pediatrics has been adopted; that is, a premature infant is an infant weighing 2500 grams ($5\frac{1}{2}$ pounds) or less at birth regardless of the period of gestation.

In 1962 there were 10,147 resident premature live births reported among 109,549 live births. Birth weight was reported on all but 70 certificates filed in 1962. Consequently, at least 9.3 per cent of the newborn babies weighed 2500 grams or less at birth. The number of premature infants by birth weight and color and by age of mother and birth weight are shown in the tables which follow:

MORTALITY

There were 39,041 resident deaths recorded in 1962. The crude death rate was 8.4 deaths per 1,000 population. Deaths were allocated to the place where the deceased resided unless the place of death item indicated that the deceased had been in the place of death for one year or more. In such cases they were allocated to the place of death, unless the death occurred in an institution. If this was the case, they were allocated to the place of residence, regardless of the length of stay in the institution.

All mortality statistics shown by cause in this report are classified according to the Seventh Decennial Revision of the International Lists of Diseases and Causes of Death. This is the fifth year that this revised statistical code has been applied to the causes of death. This revision differs slightly, if any, from the Sixth Revision, however.

In Table 14, regarding deaths from selected causes with rates, 1922-1962, it is necessary to take into consideration the effect of the revision of the International List and of the joint cause of death coding procedure in making comparisons between the trend in causes of death since 1949 with prior years. Comparability ratios for specific causes of death may be obtained upon request.

INFANT AND MATERNAL MORTALITY

There were 3,324 infant deaths and 51 maternal deaths reported. The resultant infant death rate per 1,000 live births was 30.3 while the maternal death rate was 4.7 per 10,000 live births.

In 1918 there was an all-time high rate of 101.8 infant deaths per 1,000 live births. The infant mortality rate was more than three times as high at that time as it was in 1962 while the maternal rate was nearly 23 times higher in 1918.

HOSPITAL DATA

All tables in this report which reflect events occurring in hospitals are based on the general and allied hospital definition of the North Carolina Medical Care Commission. A hospital is defined as a place where two or more non-related individuals reside 24 hours or more on the premises and receive medical care over and above any domiciliary care.

RATES

All rates shown in this report are crude rates unless otherwise specified. Such rates have not been adjusted for differences in the age, sex, color, rural or urban distribution of the population, or for underregistration or late reporting. Such factors should be kept in mind when comparing two different areas or time periods.

MARRIAGES AND DIVORCES

With the advent of central registration of marriages occurring in North Carolina, 1962 marked the completion of the vital records family in the State Board of Health. As provided for through legislation by the 1961 General Assembly, 33,968 marriages were recorded for the year 1962.

There were 6,768 absolute divorces and 95 annulments recorded for 1962, representing increases of 6.5% and 11.8% respectively over 1961. Central registration of these events has been ineffect since January 1, 1958 and, like marriage records, reflect North Carolina occurrences only.
